

设正例点为 $x_1 = (3, 3)^T$, $x_2 = (4, 3)^T$, 负例点是 $x_3 = (1, 1)^T$,
试求线性可分支持向量机。

$$\min_{\alpha} \frac{1}{2} \sum_{i=1}^l \sum_{j=1}^l y_i y_j \alpha_i \alpha_j (x_i \cdot x_j) - \sum_{j=1}^l \alpha_j$$

$$= \frac{1}{2} (18\alpha_1^2 + 25\alpha_2^2 + 2\alpha_3^2 + 42\alpha_1\alpha_2 - 12\alpha_1\alpha_3 - 14\alpha_2\alpha_3) - \alpha_1 - \alpha_2 - \alpha_3$$

$$s. t. \alpha_1 + \alpha_2 - \alpha_3 = 0$$

$$\alpha_i \geq 0, i = 1, 2, 3$$

将 $\alpha_3 = \alpha_1 + \alpha_2$ 代入目标函数并记为

$$s(\alpha_1, \alpha_2) = 4\alpha_1^2 + \frac{13}{2}\alpha_2^2 + 10\alpha_1\alpha_2 - 2\alpha_1 - 2\alpha_2$$

$$s(\alpha_1, \alpha_2) = 4\alpha_1^2 + \frac{13}{2}\alpha_2^2 + 10\alpha_1\alpha_2 - 2\alpha_1 - 2\alpha_2$$

对 α_1, α_2 求偏导并令其为 0, 易知 $s(\alpha_1, \alpha_2)$ 在点 $(3/2, -1)^T$ 取极值, 但该点不满足约束条件 $\alpha_2 \geq 0$, 所以最小值应在边界上达到。

$$\text{当 } \alpha_1 = 0 \text{ 时, 最小值 } s(0, \frac{2}{13}) = -\frac{2}{13};$$

$$\text{当 } \alpha_2 = 0 \text{ 时, 最小值 } s(\frac{1}{4}, 0) = -\frac{1}{4}.$$

于是 $s(\alpha_1, \alpha_2)$ 在 $\alpha_1 = \frac{1}{4}, \alpha_2 = 0$ 时达到最小, 此时 $\alpha_3 = \alpha_1 + \alpha_2 = \frac{1}{4}$

这样, $\alpha_1^* = \alpha_3^* = \frac{1}{4}$ 对应的实例点 x_1, x_3 是支持向量。根据式(5.9)和(5.10)计算得

$$\begin{aligned}w_1^* &= w_2^* = \frac{1}{2} \\b^* &= -2\end{aligned}$$

$$w^* = \sum_i^l \alpha_i^* y_i x_i$$

$$b^* = y_j - \sum_i^l \alpha_i^* y_i (x_i \cdot x_j)$$

分离超平面为

$$\frac{1}{2}x^{(1)} + \frac{1}{2}x^{(2)} - 2 = 0 \text{ 分离决策函数为}$$

$$f(x) = \text{sgn}\left(\frac{1}{2}x^{(1)} + \frac{1}{2}x^{(2)} - 2\right)$$

$$w^* \cdot x + b = 0$$

$$f(x) = \text{sgn}(w^* \cdot x + b^*)$$
